FLAT-BASE TYPE  
INSULATED PACKAGE

## PM50B4L1C060

### FEATURE

- a) Adopting new 5th generation Full-Gate CSTBT™ chip
  - b) Error output signal is possible from all each protection upper and lower IGBT.
  - c) The mounting surface is 90mm×50mm about 30% less than B4LA type
- Monolithic gate drive & protection logic
  - Detection, protection & status indication circuits for, short-circuit, over-temperature & under-voltage.

## APPLICATION

Photo voltaic power conditioner

## PACKAGE OUTLINES

## PRECAUTIONS FOR TESTING

1. Before applying any control supply voltage ( $V_D$ ), the input terminals should be pulled up by resistors, etc. to their corresponding supply voltage and each input signal should be kept off state.  
After this, the specified ON and OFF level setting for each input signal should be done.
2. When performing "SC" tests, the turn-off surge voltage spike at the corresponding protection operation should not be allowed to rise above  $V_{CES}$  rating of the device.  
(These test should not be done by using a curve tracer or its equivalent.)

**NOTES FOR STABLE AND SAFE OPERATION ;**

- Design the PCB pattern to minimize wiring length between opto-coupler and IPM's input terminal, and also to minimize the stray capacity between the input and output wirings of opto-coupler.
- Connect low impedance capacitor between the Vcc and GND terminal of each fast switching opto-coupler.
- Fast switching opto-couplers:  $t_{PLH}, t_{PHL} \leq 0.8\mu s$ , Use High CMR type.
- Slow switching opto-coupler: CTR > 100%
- Use 3 isolated control power supplies ( $V_D$ ). Also, care should be taken to minimize the instantaneous voltage charge of the power supply.
- Make inductance of DC bus line as small as possible, and minimize surge voltage using snubber capacitor between P and N terminal.
